Front End Development Exercise

Overview
This exercise will focus on CSS and Javascript. Through the instructions below I will create a "tablet" version of the original webpage. This tablet version will have a custom slide out left navigation, a custom header, and a custom slide up footer. Even though this will be targeted to a tablet device, the solution should work in Safari or Chrome -- you will not need to test it on a tablet unless you have one and would like to.

Instructions
1. Replace the left navigation with a slide out drawer that contains the same items. The items must be taken from the existing HTML and not hardcoded.
2. Replace the header (located with id="header") with a tablet style header that has a different look/feel. The links in the header can be changed to become a drop down or other type of interface element (such as a popup drawer/list, or something else).
3. Replace the footer with slide out drawer that has the same content. Again the content should be taken from the existing HTML and not hardcoded -- just restyled using CSS and javascript.
4. The remaining content (main content space and right navigation) should then be full width.
5. You may use any frameworks you would like including jQuery, etc.

Note: All changes must be done using CSS and Javascript with as little changes (if any) to the index.html page aside from adding any new css or javascript includes to the head of the file.
